- Introduction
- Optimization Problem
- Characteristics And Features
- Greedy Properties.
- Greedy Approach
  - ✓ The Coin Changing Problem.
  - ✓ Traveling Salesman.
- MST
- Kruskal's And Prim's Algorithm.
- Huffman Code.
- Advantages And Disadvantages

# Greedy Introduction

- Greedy algorithms are simple and straightforward.
- They are shortsighted in their approach
- A greedy algorithm is similar to a dynamic programming algorithm, but the difference is that solutions to the sub problems do not have to be known at each stage
- It is used to solve the optimization problems.

# Optimization Problems

- An optimization problem is one in which you want to find, not just a solution, but the best solution
- A “greedy algorithm” sometimes works well for optimization problems
- A greedy algorithm works in phases. At each phase:
  - ✓ You take the best you can get right now, without regard for future consequences
  - ✓ You hope that by choosing a local optimum at each step, you will end up at a global optimum

# Characteristics And Features

- To construct the solution in an optimal way.  
Algorithm Maintains two sets
  - ✓ One contains chosen items and
  - ✓ The other contains rejected items.
- Greedy algorithms make good local choices in the hope that They result in
  - ✓ An optimal solution.
  - ✓ Feasible solutions.

# Greedy Property

It consists of two property.

## **1. Greedy-Choice Property:**

It says that a globally optimal solution can be arrived at by making a locally optimal choice.

## **2. Optimal Substructure:**

An optimal global solution contains the optimal solutions of all its sub problems.

# Greedy Approach

- Greedy Algorithm works by making the decision that seems most promising at any moment; it never reconsiders this decision, whatever situation may arise later.
- As an example consider the problem of "Making Change".
- Coins available are:
  - ✓ 100 cents
  - ✓ 25 cents
  - ✓ 10 cents
  - ✓ 15 cents
  - ✓ 1 cent

# CONTINUED...

## **Problem:**

Make a change of a given amount using the smallest possible number of coins.

## **Solution:**

- ✓ The coin is selected using greedy criterion: at each stage increases the total amount of change constructed as much as possible.
- ✓ To assure feasibility i.e. the change given exactly equals the desired amount of the solution

# Coin Changing Problem

## Algorithm:

Make change for  $n$  units using the least possible number of coins.

MAKE-CHANGE ( $n$ )

$C \leftarrow \{100, 25, 10, 15, 1\}$  // constant.

$S \leftarrow \{\}$ ; // set that will hold the solution set.

Sum  $\leftarrow 0$  sum of item in solution set

**WHILE** sum not =  $n$

$x$  = largest item in set  $C$  such that  $\text{sum} + x \leq n$

**IF** no such item **THEN**

**RETURN** "No Solution"

$S \leftarrow S \cup \{\text{value of } x\}$  & Remove  $x$  from  $C$ .

sum  $\leftarrow \text{sum} + x$

**RETURN**  $S$

# Traveling Salesman

- A salesman must visit every city (starting from city *A*), and wants to cover the least possible distance
- He can revisit a city (and reuse a road) if necessary
- He does this by using a greedy algorithm: He goes to the next nearest city from wherever he is

- ✓ From *A* he goes to *B*
- ✓ From *B* he goes to *D*
- ✓ This is *not* going to result in a shortest path!
- ✓ The best result he can get now will be ***ABDBCE***, at a cost of **16**
- ✓ An actual least-cost path from *A* is ***ADBCE***, at a cost of **14**

# An Example Of MST

- A graph and one of its minimum costs spanning tree.
- Application of MST.

# Kruskal's Algorithm For Finding MST

**Step 1:** Sort all edges into non decreasing order.

**Step 2:** Add the next smallest weight edge to the forest if it will not cause a cycle.

**Step 3:** Stop if  $n-1$  edges. Otherwise, go to Step2.

# Prim's Algorithm For Finding MST

- Initialize a tree with a single vertex, chosen arbitrarily from the graph.
- Grow the tree by one edge: of the edges that connect the tree to vertices not yet in the tree, find the minimum-weight edge, and transfer it to the tree.
- Repeat step 2 (until all vertices are in the tree). And  $E=V-1$ .

# Huffman Encoding

- The Huffman encoding algorithm is a greedy algorithm
- You always pick the two smallest numbers to combine

A=00  
B=100  
C=01  
D=1010  
E=11  
F=1011

- The Huffman algorithm finds an optimal solution

# Advantages And Disadvantages

## Advantages:

- They are easier to implement.
- They require much less computing resources.
- They are much faster to execute.
- Greedy algorithms are used to solve optimization problems

## Disadvantages:

- Their only disadvantage being that they not always reach the global optimum solution.
- On the other hand, even when the global optimum solution is not reached, most of the times the reached sub-optimal solution is a very good solution.
